

As an Amateur radio operator I am concerned about interference caused by BPL to HF operations. Although I firmly believe studies have shown there will be significant interference and should not be permitted that doesn't seem to be the belief of the proponents of BPL. Therefore, strict rules need to be in place that require the suppliers of BPL to fix any reported interference to HF operations be it Amateur or commercial. As part of that the FCC staff proposed BPL industry database must be publically accessible so we the public can easily locate BPL operators so interference reports can be made to the correct parties. There must be real punishment for any BPL supplier who doesn't resolve a interference complaint in real time or fails to keep this public database up to date.
